## EXECUTIVE SUMMARY

Clear Creek Associates assembled existing geologic, hydrologic, and geophysical data from the study area and surrounding region. The data review concentrated on the local hydrogeology, available aquifer water quality, and the types and distribution of existing wells. Based on our review of the available information, Clear Creek developed a ranking of candidate areas for water production. Areas were ranked by quarter section (one quarter square mile) based on a combination of land ownership, proximity to easements, proximity to neighborhoods, proximity to existing wells, groundwater quality, proximity to future booster stations, existing well-field drawdown, and basin thickness and geologic suitability.

Through the use of the prioritization matrix, Clear Creek Associates developed 31 candidate sites based on the rankings and available information, Figure ES-1. These sites can be grouped into three general areas. These areas with the greatest potential area:

1. In Township 22 north, Range 16 west, the southwest quarters of Sections 17 and 8.
2. In Township 22 north, Range 16 west, a cluster of 18 quarter sections including the City-owned land at the waste water treatment facility, the southeast quarter of Section 3, all of Section 10, the north half of Section 15, the east half of Section 9, and the northeast quarter of Section 16.
3. In Township 22 north, Range 16 west, the southeast quarter of Section 27, all of Section 35, all of section 34 excluding the northwest quarter, the southeast quarter of Section 33, the southeast quarter of Section 35, and in Township 21 north, Range 16 west the northern half of Section 4.

At each of these locations, one would expect a reasonably good chance of adequate water production and acceptable water quality. However, in some portions of the study area including the eastern half, only limited data were available. Therefore, prior to any well installation, Clear Creek recommends that exploratory borings be installed. As part of the exploratory boring, Clear Creek recommends that the following specific analyses be conducted.

Perform lithologic and geophysical logging to confirm the location(s) of water bearing zones within the aquifer.

1. At select intervals, perform packer testing and collect depth-specific zonal groundwater quality samples for laboratory analysis.
2. Evaluate the hydrogeologic and water quality data to assess the appropriateness of installing a new production well at a specific location.

Because hydrogeologic conditions in the Hualapai Basin vary significantly over relatively short distances, Clear Creek recommends that the above outlined analysis be conducted at each candidate well site prior to well installation. This will reduce the City of Kingman's risk of completing a well with unacceptable water quality and/or poor production characteristics.

A limited study of the chromium content of the basin-fill sediments and volcanics was conducted. The results indicate that the volcanics contain significantly more chromium than do the basin-fill sediments. However, no direct correlation between the chromium content in the aquifer media versus the chromium content in the groundwater was demonstrated.

## 1.0 INTRODUCTION

This Hydrogeologic Well Siting/Basin Study has been prepared for the City of Kingman to evaluate both short-term and long-term water resource options in the Southern Hualapai Basin adjacent to Kingman, Arizona. All work was conducted in accordance with our revised proposal to the City of Kingman dated February 12, 2003 and subsequent meetings with City of Kingman personnel.

### 1.1 PROJECT SCOPE

Clear Creek assembled existing geologic and hydrologic data from the site and nearby areas. For the purpose of this investigation, the extent of the study area was approximately 96 square miles and included the northern half of the City of Kingman from Southern Avenue to Long Mountain on the north and from Stockton Hill Road on the west to approximately one mile east of the Kingman Airport, Figure 1. The data review concentrated on the local hydrogeology, available aquifer water quality (particularly hexavalent chromium), new and existing geophysics, and the types and distribution of existing wells. To aid in our hydrogeologic evaluation, a number of figures were generated to depict the local conditions.

Based on our review of the available information, Clear Creek Associates developed a ranking of candidate areas for water production. Areas were ranked by quarter section (one quarter square mile) based on a combination of factors including: status of land ownership, proximity to existing pipelines and easements, proximity to neighborhoods, impact on adjacent wells, water quality, proximity to future booster stations, current drawdown in the existing well field, and surficial and subsurface geology.

### 1.2 REPORT ORGANIZATION

The remainder of the report has been organized as outlined below. Figures, tables, and references are included at the end of the main body of the report followed by appendices.

- Section 2.0 Hydrogeology – discusses the regional and local geology and hydrology including stratigraphic and structural controls, lithology, wells, aquifer characteristics, and existing water quality.
- Section 3.0 Well Site Prioritization – reviews the methods and criteria used to rank individual areas within the study area.
- Section 4.0 Well Siting – discusses the highest priority quarter sections as determined by the prioritization matrix.
- Section 5.0 Conclusions and Recommendations – presents a summary Clear Creek’s conclusions and recommendations related to area suitable for siting new wells.
- Sections 6.0 References – includes a listing of referenced citations.

## 2.0 HYDROGEOLOGY

### 2.1 HYDROGEOLOGIC SETTING

The study area is located in the southern Hualapai basin, which lies within the Basin and Range Physiographic Province of northwestern Arizona. The Basin and Range Province is characterized by isolated mountain ranges separated by alluvial valleys. The mountain blocks are composed of a complex suite of igneous, metamorphic, sedimentary, and volcanic rocks ranging in age from Precambrian to Tertiary. The basins in the Basin and Range Province are tectonically induced troughs that have been filled to great depths with sedimentary material eroded from the surrounding mountain blocks. Metamorphic, granitic, and crystalline extrusive rocks comprise the mountains that border the basin and underlie the basin-fill deposits. The sediments comprising the subsurface strata were eroded from the surrounding highlands and deposited into the basin by streams (fluvial deposition), gravity (colluvial deposition), or lakes (lacustrine deposition). The basin-fill sediments are characterized by wide variability in their lateral and vertical distribution. The basin-fill sediments found in the southern Hualapai Basin range in thickness from a few tens of feet along the basin margins to a depth estimated to be greater than 6,000 feet near the center of the basin. At this location the basin forms a large structural depression and is the down-faulted core of the Hualapai Basin (hydroGEOPHYSICS, 2003, Appendix C.)

The basin-fill deposits are discontinuous and lenticular in character due to variations in the source rocks and depositional processes over time. Although the strata underlying the study area are discontinuous, they have been divided into several recognizable stratigraphic units by past investigators. The work of Gillespie and Bentley (1971) identified the basin fill units as Older Alluvium, Intermediate Alluvium, and Younger Alluvium. They defined the older alluvium as Tertiary-aged, moderately consolidated and poly lithic conglomerates, sands, silts, clays, evaporite deposits, and volcanic rocks. They also state that the older alluvium deposit is the principal aquifer in the Hualapai Basin. Overlying the older alluvium is the intermediate alluvium. They define the intermediate alluvium as late Tertiary in age, weakly consolidated

poly lithic conglomerates, gravels, and sands. Gillespie and Bentley (1971) described the younger alluvium as unconsolidated surficial deposits present as pediments, stream deposits (arroyo channel deposits), and playa deposits.

## 2.2 WELL INVENTORY

A well inventory for the study area was conducted by reviewing ADWR's well database and is included as Table 1. Information relating to the wells within the study area is presented in Table 1, and the locations of the wells are indicated on Figure 2. During the compilation of this well inventory, it became evident that the study area contains numerous small domestic water wells. This is potentially problematic in some areas, because even though the study area is not within an ADWR Active Management Area (AMA), water-level decline impacts of new production wells on existing wells are not desirable for a municipality. Our analysis was designed to take the proximity to existing wells into account.

## 2.3 LOCAL HYDROGEOLOGY

Clear Creek Associates prepared four hydrogeologic cross-sections and a fence diagram using lithologic descriptions from driller's logs, (Appendix A), consultant reports, and re-logging by Clear Creek Associates (Appendix B). The cross-section locations are presented on Figure 1. Cross-section A-A' is oriented from southwest to northeast, cross-section B-B' is oriented west to east, cross-section C-C' is oriented northwest to southeast, and cross section D-D' is oriented southwest to northeast. Cross-sections A-A', B-B', C-C' and D-D' are presented on Figures 3 through 6, respectively. The fence diagram incorporates all four of the cross-sections into an isometric or three-dimensional view of the southern Hualapai Basin. The fence diagram and the cross-sections depict the elevation of the water table based on data collected by the City of Kingman and Clear Creek Associates.

Cross-section A-A' (Figure 3) indicates the generalized stratigraphy of the southern portion of the Hualapai basin. The southwestern portion of the cross section depicts the shallow nature of the volcanic bedrock. As the cross section begins to enter the basin, just beyond well 55-

526516 the depth to volcanic bedrock deepens to more than 600 feet below land surface (bls). Bedrock was encountered at 670 feet bls in test well TH-4, located at the Castle Rock Booster Station. The lithologies overlying the volcanic bedrock at this location are seen as basin-fill sediments that probably belong to the *older alluvium* described by Gillespie and Bentley (1971). These sediments are predominantly above the water table and are composed of interbedded sands, silts, silty sands, and silty clays. The depth to bedrock increases to below 1200 feet in test hole TH-1 located at well City 7. The basin fill sediments at this location consist of similar unconsolidated to poorly consolidated and interbedded sands, sandy gravels, and silty sands. Farther to the northeast along this cross section the basin-fill sediments are predominantly poorly consolidated and silty sands. The groundwater table surface is indicated on the cross section by a dashed blue line. In the vicinity of shallow bedrock on the southern end of the cross section, the water level is affected by the location of faults. Note that depth to water southwest of the fault between well 55-526516 and TH-4 is approximately 100 feet. However, depth to water in TH-4 is below 630 feet. Water levels from TH-4 through the northeast end of the cross section remain fairly consistent, near the 2,800-foot elevation.

Cross-section B-B' (Figure 4) is similar in many ways to cross section A-A'. In the western portion of the cross section the depth to granite gneiss bedrock is less than 100 feet. A significant basin-bounding fault is located between wells 55-575340 and 55-501694 that drops the depth to bedrock to below 500 feet and also impacts the depth to the water table. The water table elevations decline along this fault and the next fault to the east. At that point the water table elevation remains fairly consistent through monitor well MW-2. At least three additional basin bounding faults are indicated on the cross section before the location of well LMV-2. Depth to basement in the vicinity of well LMV-2 is unknown.

Cross-section C-C' (Figure 5) crosses sections A-A', B-B', and D-D' and trends from northwest to southeast. This cross section begins at cross section B-B' and is constructed to show the hydrogeologic complexities along the southwestern edge of the Hualapai basin. It also crosses through test hole TH-2 and the location of the abandoned well City 8. The most dramatic hydrogeologic difference depicted in this cross section is the occurrence of a thick and

consolidated volcanic conglomerate. Well City 8 encountered this lithology above the static water level and remained in this unit through the bottom of the boring. Primary porosity in this unit is low. Water production from this unit is expected to be restricted to areas of well developed fracturing or faulting. Well City 5 is constructed in a similar unit. However, the significant yield from this well suggests that the volcanic conglomerate exhibits sufficient secondary porosity for production of such quantities of water.

Cross-section D-D' (Figure 6) was constructed to facilitate the construction of the fence diagram. This section trends parallel to cross-section A-A' and joins cross-section A-A' at wells 55-526516 and 55-529815. This section depicts how dramatically the Hualapai basin deepens towards the northeast. It also indicates that the consolidated volcanic conglomerate encountered in well City 8 is not a significant component of the stratigraphy northeast of well City 8.

The fence diagram (Figure 7) is an isometric presentation of all of the cross sections depicted at the same time. This diagram illustrates the deepening of the basin in a northeasterly direction. It also helps to identify the basin-bounding faults responsible for the development of the basin.

The available geologic data indicates that an extensive and relatively thick sequence of volcanic flows, volcanic conglomerates, and volcanic gravels are present beneath much of the southwestern portion of the study area. The significant thickness and relatively shallow depth of these units effectively precludes this portion of the basin from future high-yield supply well consideration.

### **2.3.1 Groundwater decline**

Water level data collected from 24 existing wells during the period from October of 2002 through April of 2003 by the City of Kingman and by Clear Creek Associates is depicted in Table 2. Water level hydrographs (Figures 8-12) were produced for selected wells to illustrate the recent drawdown throughout the central well field. The hydrographs are all referenced to

the U.S.G.S. water level datum of 1967. The range of water level decline is from -1.2 feet per year (ft/yr) to -2.2 ft/yr with an average rate of decline of -1.55 feet per year.

## 2.4 GEOPHYSICS

At the request of the City of Kingman, hydroGEOPHYSICS, Inc. of Tucson, Arizona conducted a gravity survey of the southern portion of the Hualapai Basin. Their study area roughly coincided with the Clear Creek Associates study area. A brief review of the results of the gravity survey is presented here. At the request of the City, the full hydroGEOPHYSICS report is included with this report as Appendix C.

Gravity surveys are capable of differentiating rocks of varying densities, thus separating unconsolidated basin-fill gravels and volcanic rocks from bedrock. The hydroGEOPHYSICS gravity survey model runs identified the deepest portion of the basin to be located approximately two miles north of the City of Kingman airport, the "airport sub-basin." The shallower portions of the basin, particularly in the western half of the study area, surrounding the airport sub-basin, form shelf-like features that progressively deepen towards the basin center. These shelf-like features, or plateaus, are believed to be a result of extensional basin and range normal faulting. An example of a shallow plateau can be found on cross-section C-C' in the vicinity of City Well No. 8. The trend of this plateau is easterly and suggests shallow basement a distance of approximately two miles east of City Well No. 8. Depth to bedrock in the plateau regions of the basin is estimated to range from 500 feet to as much as 3,000 feet below land surface (bls). The central portion of the airport sub-basin deepens to as much as 6,000 feet bls. Bedrock is inferred below this depth.

## 2.5 CHROMIUM AND SOURCE ROCKS

Naturally occurring hexavalent chromium has been documented within several Arizona basins including the Hualapai basin Robertson, (1991). Clear Creek Associates, in conjunction with the City of Kingman, reviewed the hexavalent chromium data for selected wells within the

study area. The purpose of this review was to select wells that currently produce water with low total chromium and wells that produce water with elevated chromium levels and submit samples of the drill-cuttings from these wells to an analytical laboratory for determination of total chromium. The cuttings samples were prepared at the analytical laboratory by pulverizing the samples in ceramic mills and then taking the samples into solution by total digestion with hydrofluoric, nitric, and sulfuric acids. Total chromium values were then determined by ACTLABS-SKYLINE of Tucson Arizona by inductively coupled plasma – emission spectroscopy (ICP). It has been found through City of Kingman and Clear Creek Associates investigations, that hexavalent chromium in groundwater samples represents greater than 90% of the total chromium values. Assay certificates can be found in Appendix D.

As a result of this review, five wells were selected; Test Hole No. 1 (55-502501), Test Hole No. 2 (55-571222), the observation well at City Well No. 6 (55-529815), Long Mountain Well No.2 (55-504272), and Test Hole No. 4 (55-529815). Table 3 depicts the samples chosen, chromium content of the water, chromium content of the cuttings, and the general lithologic description of the cuttings. Figures 13-17 illustrate the direct comparison of total chromium in the cuttings versus hexavalent chromium in the test well zonal samples or production well discharge samples.

Review of these data indicates that the volcanic rocks encountered in test hole TH-4 contain the highest total chromium values. As can be seen in Table 3 these values range from 264 parts per million (ppm) up to 452 ppm. Samples from the other wells were all within the basin-fill sediments. Total Chromium values from these samples ranged from 41 ppm up to 136 ppm, or approximately an order of magnitude lower. The hexavalent chromium values from the depth-specific water samples collected during the drilling of these wells ranges from nil up to 0.18 milligrams per liter (mg/L also ppm). Visual inspection of the water values verses the values from the cuttings samples does not suggest a direct correlation. It is compelling however, to assign the source for the chromium in the groundwater to the andesitic/basaltic volcanic rocks simply because these lithologies contain the highest concentration of total chromium. The

mechanism controlling the leaching of the chromium from the host lithology is unknown at this time. Likewise, the process for the conversion of trivalent chromium to hexavalent chromium is also unknown.

## 2.6 WATER QUALITY

Clear Creek Associates reviewed inorganic groundwater quality from existing and newly acquired water quality samples from selected wells within the study area. Our water-quality evaluation focused on the more common inorganic parameters that may affect the siting of water production wells. These analytes consisted of: nitrate, fluoride, arsenic, total chromium, calcium, magnesium, potassium, alkalinity, sulfate, chloride and total dissolved solids (TDS). The reported concentrations of these constituents are presented in Table 4 and certificates are in Appendix E.

The State and Federal drinking water standards that define the Maximum Contaminant Level (MCL) are enforceable by regulatory agencies. Nitrate has an MCL of 10.0 mg/L, and fluoride has an MCL of 4.0 mg/L. Arsenic currently has an MCL of 0.05 mg/L, or 50 micrograms per liter ( $\mu\text{g/L}$ ), but that standard has been revised to a more stringent MCL of 0.01 mg/L (10  $\mu\text{g/L}$ ), which will become effective in January of 2006. Chromium has an MCL of 0.1 mg/L, nitrite has an MCL of 1.0 mg/L. TDS has a Secondary Drinking Water Standard of 500 mg/L, that is a non-enforceable guideline. Sulfate and chloride also have Secondary Drink Water Standards of 250 mg/L.

The reported chromium concentration in all wells was below the current MCL. The Stucky Well (55-606422) was not sampled during this project however a sample collected in 1998 had a reported chromium value of 0.099 mg/L.

The reported TDS concentration in the Bank Street Well of 740 mg/L, exceed the Secondary Maximum Contaminant Level for TDS. The reported TDS concentrations from all wells ranged from 210 to 740 mg/L. The Bank Street Well is probably screened in a portion of the

regional aquifer media where elevated TDS concentrations may result from naturally occurring mineral leachate. No other analytes exceeded either primary or secondary standards.

### 3.0 PRIORITIZATION MATRIX

An analysis of the study area was performed to identify and prioritize candidate sites for the installation of new public supply wells to meet the City's current and future water demands. Clear Creek Associates developed this prioritization matrix as a tool for the City of Kingman to use to help select future well sites.

#### 3.1 PRIORITIZATION METHODOLOGY

The prioritization of well sites within the study area was conducted on the basis of eight prioritization criteria, presented here, and summarized in Table 5. Based on the relative importance of each criterion and the value of a well site to the City of Kingman, each criterion was assigned a multiplier. The multiplier provides a weighted value to each criterion, and assigns the appropriate degree of importance to it, which can then be considered in the overall ranking of the well sites. For example, the *proximity to pipelines/easements* is less important than the *groundwater quality* at that location. This is because the additional cost for installing a pipeline extension is expected to be less than the additional cost for water treatment or blending. The eight criteria used in the analysis, along with their multipliers, are presented below:

<u>Criterion for Prioritization</u>	<u>Multiplier</u>	<u>Maximum Points Achievable</u>
Land Ownership	1	3
Proximity to Pipelines/Easements	2	4
Proximity to Neighborhoods	1	2
Proximity to Existing Wells	3	6
Groundwater Quality	5	10
Proximity to Future Booster Stations	7	21
Current Drawdown	5	10
Geology	10	30

The criteria with larger multipliers, such as geology, are more heavily weighted in this analysis. The magnitude of each multiplier is proportional to the actual impact that the criterion would have on potential well sites. While the Maximum Points Achievable values are only indirectly correlative to the multiplier values (due to the impact of the site-by-site rankings discussed below), they provide an indication of the relative importance assigned to each criterion.

The geology criterion had the highest relative importance because the cost of well installation would not be substantiated at locations with inadequate potential groundwater production. The proximity to future booster stations criterion was ranked second in importance since the water yielded by a well is relatively meaningless unless that same water can be delivered to the distribution system. Groundwater quality and current drawdown were ranked equally and are third in importance because poor quality water is unacceptable for potable use without expensive treatment or blending. Additionally, any new well constructed within the area of accelerated drawdown would only exacerbate the rate of drawdown. The impact of a potential new well to existing wells was the fourth-ranked criterion. Due to the relatively low number of existing private wells within the study area, the well impact criterion is not a major concern. The proximity to pipelines/easements was assigned the next lowest relative value. Land ownership was assigned the lowest relative value. While the land status is an important consideration, it has a relatively low impact on the utility and value of a completed public supply well, in comparison to the other criteria. Similarly, the proximity of a potential well site to an existing pipeline is an important consideration, but this criterion is less critical than the overlying importance of the other higher-valued criteria.

After a multiplier was assigned to each ranking criterion, the City of Kingman study area was evaluated and ranked on a quarter-section-by-quarter-section basis. The ranked value of each quarter-section (160-acre) parcel was then multiplied by the multiplier value of that particular criterion, to result in a *weighted prioritization value*, as follows:

(rank) x (multiplier) = weighted prioritization value

The sum of all the weighted prioritization values (from all eight criteria) for each quarter-section parcel was then used to make a valid comparison between that quarter-section parcel and all other parcels within the study area, and to assign a ranking to the various potential well sites.

The assigned rank and calculated prioritization value for each quarter-section parcel within the study area is presented in Table 6. The sum of the calculated prioritization values for each parcel of land resulted in a ranking of “greatest suitability,” “moderate suitability,” “low suitability,” or “does not qualify.” The well site rankings are presented graphically on Figure 18. Four of the criteria contain a potential zero (0) value due to the conditions that would preclude installation of a production well. These criteria include: proximity to neighborhoods, water quality, drawdown, and basin-fill thickness and geology. When one of these criteria produces a quarter section with a zero value then that quarter section maintains a zero value regardless of the other criteria scoring.

The quarter-section well site parcels presented in Table 6 are organized in progressive order, from west-to-east and north-to-south with a column and row designation. The columns and rows that are referenced in Table 6 are also shown on Figure 18 for cross-reference. The cross-reference between Table 6 and Figure 18 allows for easy correlation between the numerical ranking of each parcel (Table 6) and the graphical prioritization of each parcel (Figure 18). For example, Section 3 in Township 22 North, Range 16 West is located in column 6 and row 4 (Figure 18). This section can be found in Table 6 by looking up the corresponding column and row numbers. The section is then broken down into quarter-sections, and each quarter is assigned a letter in counter-clockwise order, where:

- a = the northeast quarter-section,
- b = the northwest quarter-section,
- c = the southwest quarter-section, and
- d = the southeast quarter-section.

### 3.2 RATIONALE FOR RANKING OF EACH CRITERION

Each of the prioritization criteria was ranked for each quarter-section parcel on the basis of the following rationale. The higher the resulting ranking-number the more favorable the condition.

#### 3.2.1 Land Ownership Ranking

Plate 1 depicts the ranking of each quarter section for the *land ownership* criteria. Whether or not a potential well site is on state-owned, private-owned, federal-owned, or city-owned land affects the ease of acquiring access to the land. Therefore, the basis for the land ownership ranking was:

<u>Land Ownership</u>	<u>Rank</u>
State	1
Private	2
Federal	2
City	3

#### 3.2.2 Proximity to Pipelines/Easements

Plate 2 depicts the ranking of each quarter section for the *proximity to pipelines/easements* criteria. The proximity to an existing or planned pipeline or existing easement will impact the ultimate cost of the water. A well further than 1 mile from an easement would require a significant expenditure for new easement acquisition. Therefore, the basis for the proximity to pipelines and easements ranking was:

<u>Proximity to Pipeline/Easements</u>	<u>Rank</u>
More than 1-mile	1
Less than or equal to 1-mile	2

### 3.2.3 Proximity to Neighborhoods Ranking

Plate 3 depicts the ranking of each quarter section for the *proximity to neighborhoods* criteria. Operational noise at wellheads is a consideration the City takes seriously. Future well sites that are less than ½ mile from existing neighborhoods are ranked with a “0,” which ultimately precludes the site from consideration. All sites greater ½ mile from homes were ranked equally. Therefore the ranking was based on:

<u>Proximity to Neighborhoods</u>	<u>Rank</u>
Less than ½	0
Greater than or equal to ½	1

### 3.2.4 Proximity to Existing Wells Ranking

Plate 4 depicts the ranking of each quarter section for the *proximity to existing wells* criteria. The potential future impact on any existing wells in the study area was considered to be greatest if more than one well existed within the quarter section being scored. Numerous existing wells are located within the study area. Therefore, the basis for the impacts on existing wells ranking was:

<u>Number of Existing Non-City Wells in Same quarter-Section</u>	<u>Rank</u>
More than 1 existing well within quarter-section	1
Less than or equal to 1 existing well within quarter-section	2

### 3.2.5 Water Quality Ranking

Plate 5 depicts the ranking of each quarter section for the *water quality* criteria. Groundwater of poor quality may require blending or treatment prior to its use, at substantial additional cost. Plate 5 contains Stiff diagrams depicting the results of the water quality sampling completed by Clear Creek Associates. Review of these groundwater quality data indicated that chromium was the only constituent of potential concern within the study area. Therefore, the basis for the groundwater quality ranking was:

<u>Water Quality</u>	<u>Rank</u>
----------------------	-------------

Total Chromium greater than or equal to 0.10 mg/L	0
No data within ½ mile	1
Total Chromium greater than 0.05 mg/L and less than 0.10 mg/L	1
Total Chromium less than 0.05 mg/L	2

### 3.2.6 Proximity to Future Booster Stations Ranking

Plate 6 depicts the ranking of each quarter section for the *proximity to future booster stations* criteria. Currently the City of Kingman has little excess capacity to handle additional groundwater production. Therefore a key component of this study was the proposed location of future booster stations. Therefore, the basis for the future booster station ranking was:

<u>Proximity to Future Booster Station</u>	<u>Rank</u>
Greater than 1½ miles	1
Between 1 and 1½ miles	2
Less than 1 mile	3

### 3.2.7 Water Table Drawdown Ranking

Plate 7 depicts the ranking of each quarter section for the *drawdown* criteria. The City of Kingman's central well field currently exhibits water table drawdown ranging from 20 to 60 feet below the U.S.G.S. 1967 water table elevation datum. Installation of additional production wells within the area of greatest drawdown has the potential of negatively impacting existing wells. Additional drawdown in the central well field could result in increased pumping costs, inadequate submergence, cascading water, and overall reduction in well-field yield. Therefore, the basis for the drawdown ranking was:

<u>Existing Drawdown</u>	<u>Rank</u>
Greater than or equal to 50 feet	0
Between 30 and 50 feet	1
Less than or equal to 30 feet	2

### 3.2.8 Basin-fill Thickness and Geology Ranking

Plate 8 depicts the ranking of each quarter section for the *basin-fill thickness and geology* criteria. The geological setting for the southern portion of the Hualapai basin is complex and directly impacts water well yields. Some of the wells currently owned and operated by the City of Kingman are constructed in highly fractured bedrock, i.e. advanced development of secondary porosity. Although the yields on these wells are satisfactory, targeting bedrock with well-developed secondary porosity is not considered to be prudent. The criteria for this ranking were therefore based on the range of thickness of basin-fill sediments overlying bedrock. A thickness of less than 300 feet was considered to be the lowest priority due to the general depth to the water table being in excess of 500 feet. All of the basin-fill sediments described in the driller and consultant logs are generally coarse-grained enough to be considered good aquifer media. With a few exceptions, consolidation and cementation are generally low and clay content does not seem to be sufficiently high so as to reduce yields. Therefore, the basis for the geology ranking was:

<u>Geology</u>	<u>Rank</u>
Greater than 50% Crystalline Rock and less than 300 feet of basin-fill	0
Basin-fill sediments less than 500 feet thick	1
Basin-fill sediments between 500 and 1,000 feet thick	2
Basin-fill sediments greater than 1,000 feet thick	3

## 4.0 WELL SITING

The sums of the calculated prioritization values for each quarter-section parcel of land within the study area are shown in Table 6. The land parcels that were evaluated have been prioritized into four general categories, to facilitate graphical delineation of the well site prioritization zones. The basis for the well site prioritization ranking was:

<u>Sum of Calculated Value</u>	<u>Rank</u>
More than 70	Greatest Suitability For Groundwater Production
46 to 70	Moderate Suitability For Groundwater Production
20 to 45	Poor Suitability For Groundwater Production
Less than 20	Does Not Qualify

Based on available information, Clear Creek Associates developed 27 candidate quarter sections Figure 18 and Plate 9. Scores for these quarter sections are relatively similar and range from 71 to 78. The three areas identified with the greatest potential are:

4. In Township 22 north, Range 16 west, the southwest quarter of Sections 17 and 8.
5. In Township 22 north, Range 16 west, a cluster of 18 quarter sections including the City-owned land at the waste water treatment facility, the southeast quarter of Section 3, all of Section 10, the north half of Section 15, the east half of Section 9, and the northeast quarter of Section 16.
6. In Township 22 north, Range 16 west, the southeast quarter of Section 27, all of Section 34 excluding the northwest quarter, the southeast quarter of Section 33, the southeast quarter of Section 35, and in Township 21 north, Range 16 west the northwest quarter of Section 4.

The third area is located south and west of the Kingman Municipal Airport. This area is perhaps best suited for future exploratory borings due to its relative proximity to the existing City infrastructure, the current population mass, and future growth.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of this investigation, Clear Creek Associates offers the following conclusions and recommendations with respect to long-term water resource planning and short-term water resources needs for the City of Kingman.

Based on available information, Clear Creek Associates developed 27 candidate quarter sections that may be suitable for future groundwater production. Further refinement of the ranking of these sites is recommended before site selection. Site selection can be facilitated by on-site inspections to assess the logistical implications of installing a production well at each site. However, at each of these locations one would expect a reasonably good chance of significant water production and acceptable water quality. It must be noted that in some portions of the study area including the eastern half, only limited data were available. Therefore, prior to any well installation, Clear Creek Associates recommends that an exploratory boring be installed. As part of the exploratory boring, Clear Creek Associates recommends that the following specific analyses be conducted.

3. Perform lithologic and geophysical logging to confirm the location(s) of water bearing zones within the aquifer.
4. At select intervals, perform packer testing and collect depth-specific zonal groundwater quality samples for laboratory analysis.
5. Evaluate the hydrogeologic and water quality data to assess the appropriateness of installing a new production well at a specific location.

Because hydrogeologic conditions can vary significantly over relatively short distances, Clear Creek Associates recommends that the above outlined analysis be conducted at each candidate well site prior to well installation. This will reduce the City of Kingman's risk of completing a well with unacceptable water quality and/or poor production characteristics. As the City's needs change and as conditions within the study area change, the prioritization ranking and multipliers may need adjusting. The electronic version of the Matrix spreadsheet (Excel) as well as all drawing files is included with this report on compact disk as Appendix F.

### Geological Notes

Basin fill- Gravels, sands, and silts.  
Sub-angular clasts composed of quartz and feldspar.

Silty clays few sand grains.

Silty sands with minor clay content.

Sandy silty gravels with volcanic and granitic clasts (50/50 clast ratio).

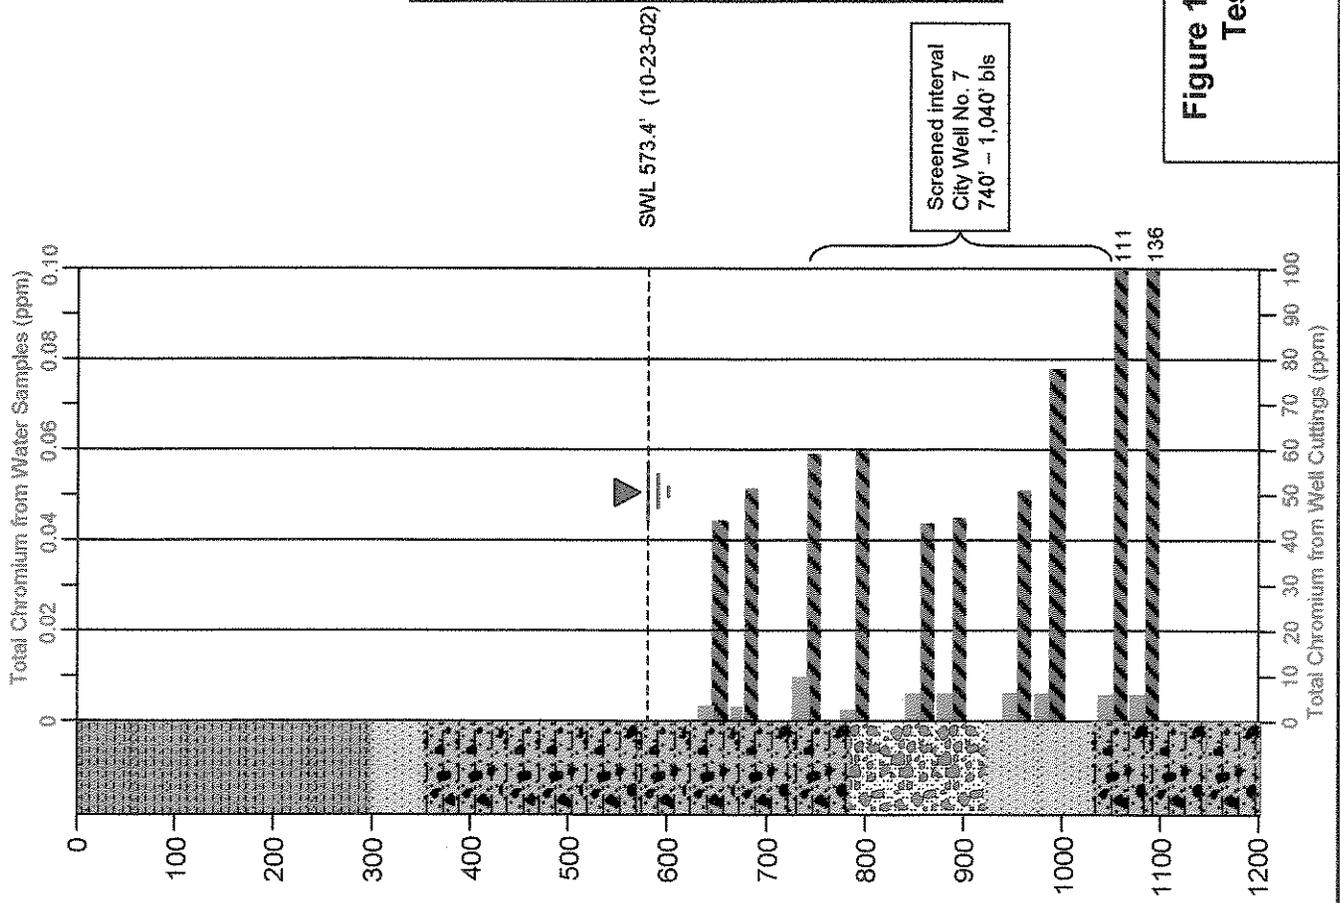

Same as above with clast ratio now 60% volcanics.

Same as above with clast ratio now 70% volcanics.

Sandy fine-grained gravels predominantly volcanics.

Coarse-grained sands with minor silt, predominantly volcanics.

Coarse-grained sands with minor silt, clasts are 60-65% basalt.

**Explanation**

Table 3. Chromium Values in Water and Cuttings.

Well	Sample Interval	Chromium Content in Water mg/L	Chromium content in Cuttings mg/L	Lithology
TH-1	640-660	nil	44	Sandy silty gravels. Mixed volcanics and granitics.
	680-700	nil	52	Coarse-grained sands and silts. Clasts are 60% volcanics 40% granitics.
	740-760	0.01	59	As above
	780-800	nil	60	Sandy gravels. Clasts are 70% volcanics, 30% granitics.
	840-860	nil	45	As above
	880-900	0.01	47	As above
	940-960	nil	51	Coarse-grained sands and silts. Clasts are +70% volcanics <30% granitics.
	980-1000	nil	77	As above
	1040-1060	nil	111	Coarse-grained sands. Clasts are 65% basaltic volcanics
	1080-1100	0.01	136	As above
TH-3	660-680	NA	87	Silty coarse-grained sands. Clasts are 55% granitics, 45% volcanics.
	680-700	nil	85	Sandy silts. Clast content unchanged.
	760-780	0.03 to 0.04	59	Coarse-grained sand to sandy gravel. Clast content Predominantly Volcanics.
	780-800	0.04	54	As above but increased consolidation due to calcite cementation.
	840-860	0.04	57	As above
	880-890	0.03 to 0.04	55	As above
	940-960	0.03 to 0.04	48	As above
	980-1000	0.03 to 0.04	31	As above however calst content changes to 80% volcanics, 20% granitics.
	1020-1040	0.04 to 0.05	57	As above
	1080-1100	0.05 to 0.06	73	As above
City 6 OB Well	640-650	0.031	73	Sandy silty gravels. Clasts are predominantly granitics with only minor volcanics.
	690-700	0.018	92	Coarse-grained sands nad silty sands. Clasts are predominantly granitic.
	700-710	0.018	52	As above
	740-750	0.032	57	As above
	750-760	0.032	74	As above
	790-800	0.031	51	Fine-grained gravels and silty sands. Clasts are 70% granitics and 30% volcanics.
	840-850	0.039	66	Coarse-grained sands and sandy gravels. Clasts are 50% granitic and 50% volcanics.
	890-900	0.15	52	As above
	940-950	0.044	57	As above
	990-1000	0.1	46	As above
	1000-1050	0.18	NA	As above
	1050-1100	0.17	NA	As above
	1100-1050	0.046	NA	As above
1050-1200	0.18	NA	As above	
Long Mtn. No. 2	640-650	0.04 <sup>3</sup>	46	Sandy gravels. Clast composition 60% volcanics, 30% granitics 10% mafics.
	690-700	0.04 <sup>3</sup>	48	As above, however clasts are now 40% granitics, 40% volcanics, 20% mafics.
	740-750	0.04 <sup>3</sup>	45	As above however clasts are now 65% volcanics, 25% granitics, 10% mafics.
	790-800	0.04 <sup>3</sup>	55	As above
	840-850	0.04 <sup>3</sup>	51	As above
	890-900	0.04 <sup>3</sup>	54	As above
	940-950	0.04 <sup>3</sup>	41	As above, however mafic content now at 15%.
	990-1000	0.04 <sup>3</sup>	41	As above, however mafic content now at 10%.
	1040-1050	0.04 <sup>3</sup>	88	As above
	1090-1100	0.04 <sup>3</sup>	67	As above
TH-4	700-710	N.S. <sup>2</sup>	264	Basaltic/Andesitic volcanics, clay altered.
	740-750	< 0.01	406	As above, however no clay alteration.
	800-810	0.014	429	As above
	840-850	0.06 <sup>1</sup>	398	As above
	900-910	0.07 <sup>1</sup>	452	As above, however increased clay alteration.
	940-950	0.049	451	Volcanics, basaltic flow, very weak clay alteration.
	980-990	0.05	416	Oxidized volcanics, minor imbedded arkosic sediments.
	1040-1050	0.039	450	As above
	1080-1090	0.052	412	Andesitic volcanic flow.
	1120-1130	0.054	358	Mixed volcanics and interbedded arkosic sediments.

Notes:

**APPENDIX A**

**ARIZONA DEPARTMENT OF WATER RESOURCES  
GROUNDWATER MANAGEMENT SUPPORT SECTION  
500 North Third Street  
Phoenix, Arizona 85004-3903**

**VARIANCE GRANTED**

**THIS AUTHORIZATION SHALL BE IN POSSESSION OF THE DRILLER DURING ALL DRILL OPERATIONS**

**WELL REGISTRATION NO: 55-571223**

**AUTHORIZED DRILLER: THF DRILLING, INC.**

**LICENSE NO: 611**

**NOTICE OF INTENTION TO DRILL MONITOR WELL(S) HAS BEEN FILED WITH THE DEPARTMENT BY:**

**CONSULTANT:**

**WELL OWNER: CITY OF KINGMAN 310 N FOURTH STREET KINGMAN, AZ 86401**

**The well(s) is/are to be located in the:**

**SW 1/4 of the NW 1/4 of the SW 1/4 Section 20 Township 22 NORTH Range 16 WEST**

**No. of Wells in this project: 1**

**THIS AUTHORIZATION EXPIRES AT MIDNIGHT ON THE 6TH DAY OF OCTOBER, 1999.**

  
\_\_\_\_\_  
**CHIEF, GROUNDWATER MANAGEMENT SUPPORT**

**THE DRILLER MUST FILE A LOG OF THE WELL  
WITHIN 30 DAYS OF COMPLETION OF DRILLING**

17. If construction plans have been coordinated with Arizona Department of Environmental Quality, who is the agency contact? NOT YET

**PRODUCTION WELLS WILL BE APPROVED BY ADEQ**

If construction plans have been coordinated with Arizona Department of Water Resources, who is the agency contact? \_\_\_\_\_

**18. WELL CONSTRUCTION PLAN:**

a) Drilling method (mud rotary, hollow-stem auger, etc.) REVERSE CIRCULATION ROTARY

b) Borehole diameters: 12 inches from 0 feet to 20 feet.  
5\* inches from 20 feet to 1200 feet.

\*TO BE REAMED FOR CASING  
c) Casing materials (PVC, steel, hollow-stem auger, etc.)  
material SCH 80 PVC diameter 4 inches from 0 feet to 1200 feet.  
material \_\_\_\_\_ diameter \_\_\_\_\_ inches from \_\_\_\_\_ feet to \_\_\_\_\_ feet.

d) Method of sealing at reductions N/A

e) Annular seal materials (cement, grout, etc.); method of placement (tremied, circulated):  
material GROUT / cement method \_\_\_\_\_ from 0 feet to 20 feet.  
material \_\_\_\_\_ method \_\_\_\_\_ from \_\_\_\_\_ feet to \_\_\_\_\_ feet.

f) Filter packs (state material):  
material N/A from \_\_\_\_\_ feet to \_\_\_\_\_ feet.  
material \_\_\_\_\_ from \_\_\_\_\_ feet to \_\_\_\_\_ feet.

g) Perforations or screen specifications:  
Type 4-3" SAW CUTS/LF from 600 EST feet to 1200 feet.  
Type \_\_\_\_\_ from \_\_\_\_\_ feet to \_\_\_\_\_ feet.

h) Method of well development (bail, air lift, surge) N/A

i) Will surface or conductor casing extend above grade?: Yes XXX No \_\_\_\_\_

19. Include detailed construction diagram showing expected water depth in feet below land surface, and details of vault, if specified.

**GENERAL INSTRUCTIONS**

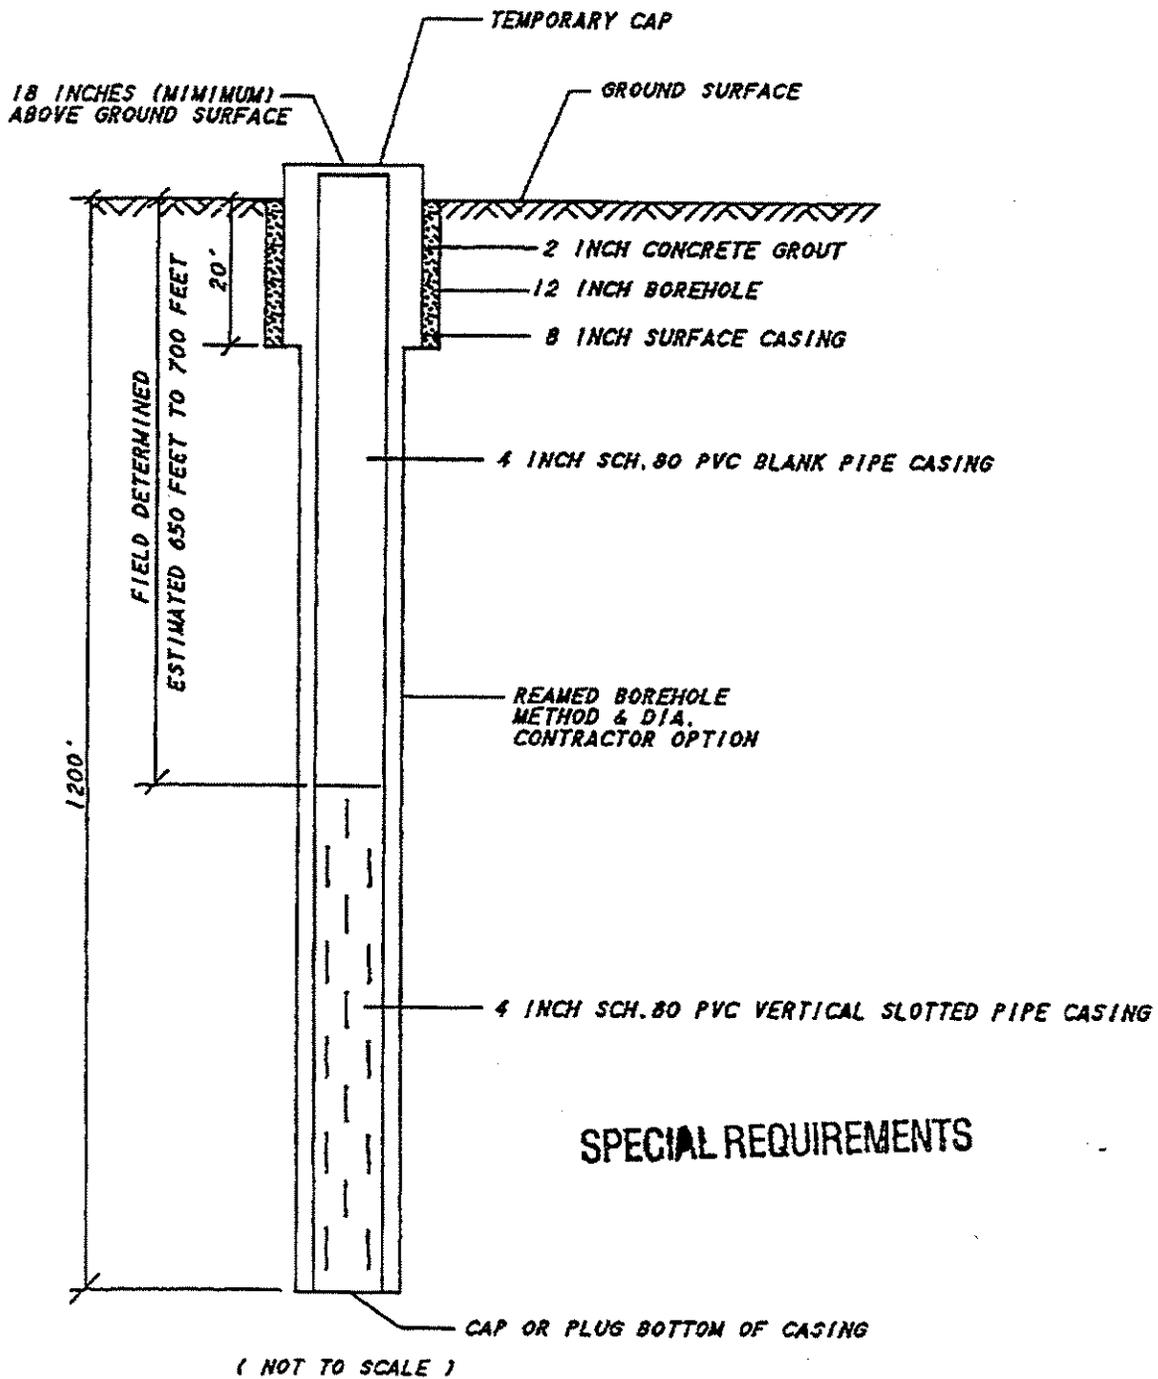

1. Please submit two original notices, with original signatures, and a check or money order (no cash) in the amount of \$10.00, to P.O. Box 458, Phoenix, Arizona 85001-0458 or hand deliver to 500 North 3rd Street, Phoenix, Arizona .

**CONDITIONS**

1. If an individual other than the land owner or lessee, signs this notice, an original letter of authorization from the land owner/lessee, stating that the individual has permission to sign this specific Notice on their behalf, shall accompany the Notice of Intention to Drill a Monitor/Piezometer Well form.
2. Construction and abandonment standards for all wells shall be in accordance with A.A.C. R12-15-811 and R12-15-816.
3. Drilling of the well shall be completed within one year after the date of Notice.
4. A Well Driller Report is required within thirty days of completion of drilling. A Completion Report, is required to be filed with the Department within thirty days after installation of pump equipment for monitor wells.
5. Pump equipment may not be installed on a well drilled for piezometer purposes. If a monitor well is pumped, pumping is limited to the maximum amount required for monitor purposes, but in no case may exceed 35 gallons per minute and an annual volume of 10 acre feet total.
6. A.A.C. Rule R12-15-811.H.2, requires that: "A monitor well shall be identified as such on the vault cover or at the top of the steel casing. Identification information will include well registration number."
7. Special construction standards required pursuant to A.A.C. Rule R12-15-821: \_\_\_\_\_

Subject: Request for Variance

Dear Jim:

On behalf of NJ Devlin Consulting Engineers, THF Drilling, Inc. requests a variance in the construction of one (1) 4-inch groundwater monitor/piezometer well to a depth of 1200', for the City of Kingman located at Township 22 North, Range 16 West, of the SW ¼, NW ¼, SW ¼ of Section 20 in Kingman, Arizona.

The groundwater monitor/piezometer well will be constructed with Sch. 80 PVC casing in the upper 20' of the well, in lieu of the required 20' of steel casing.

Thank you for your attention to this request for variance. The timing on receiving the Drill Card on this project is extremely important, if you have any questions please call us at (602) 254-6586.

Sincerely,

THF Drilling, Inc.

Re: **Variance for Construction of Three Monitor Wells  
Registration Numbers 55-571222 through 55-571224**

Dear Mr. Truax:

The Arizona Department of Water Resources received your request dated October 6, 1998 for a variance for construction of three monitor wells to be located in Mohave County. The purpose of these wells will be to monitor ground water levels .

The Arizona Department of Water Resources approves this request for the following variance:

- Thermoplastic casings (risers) with a watertight cap may be used in lieu of steel casings (R12-15-811.B.1).

The following *special requirements* are conditions for this variance (R12-15-821.):

- The PVC inner casings (risers) shall comply with ASTM Standard Guide D5092, Section 6.5.
- The wells shall be constructed per the "Variance Granted" Notice of Intention to Drill.
- The wells shall be abandoned (decommissioned) per A.A.C. R12-15-816.

If you have any questions, please contact James L. Johnson of my staff at (602) 417-2400 ext.# 7268.

Sincerely,

Greg Wallace  
Chief Hydrologist

# Kingman, City of

# INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

## General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form in duplicate with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.
2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.
3. No registration fee is required for Exempt Wells. A \$10.00 registration fee must accompany registration forms for all Non-Exempt Wells.
4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.
5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

## INSTRUCTIONS FOR REGISTRATION QUESTIONS

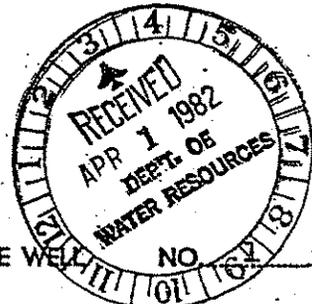

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.
2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.
  - a. Fill in the Section, Township and Range in all cases if it is available.
  - b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.Show all purposes for which the water is used.

If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.
- Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.
- The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

GENERAL INSTRUCTIONS

- Fill out this form in duplicate and send to 99 East Virginia, Suite 100, Phoenix, Az. 85004.
- For specific instructions, limitations and conditions, see the reverse side of this form.
- This form is to be used to drill, deepen or replace an exempt well used for domestic and/or stockwatering in an Active Management Area.
- If the exempt well is a replacement or deepening of an existing well, provide the registration number of the existing well in Item 19.
- Construction standards for new and replacement wells and the deepening and abandonment of existing wells, shall be in accordance with Department Rules and Regulations.

I state that this Notice is filed in compliance with ARS 545-596 and is complete and correct to the best of my knowledge and belief and that I understand the limitations under which I must operate this exempt well for domestic purposes as set forth on the reverse side of this form.

Registration No. 55-515980

Dear Well Owner:

Enclosed for your records is a copy of the Notice of Intention to Drill a well which was recently filed with this Department. This is returned to you as evidence of compliance with ARS §45-596. Also enclosed is a Completion Report to be submitted when pump equipment is installed. Your driller has been mailed separately a Well Drilling Card and a Well Drilling Report form. Your driller may not begin to drill your well until he has received the Well Drilling Card, and is required to display the Drilling Card on his rig while drilling. If you elect to change drillers, you are required to notify this Department of that fact and who the new driller is. Please ensure that any driller you elect to use is properly licensed to drill the type of well you require since licensed well drillers must pass an examination that proves they understand professional well drilling methods and they are familiar with the laws and regulations which govern well construction in Arizona.

In the event that you determine it necessary to change the location of the proposed well, you should obtain the written permission of the Department of Water Resources before proceeding with the drilling. A properly signed amended Drilling Card must be in the possession of the driller before drilling commences at a different location than originally authorized.

ARS §45-600 requires the registered well owner to submit a Completion Report within 30 days after the installation of pumping equipment. It also requires the driller to furnish this Department a complete and accurate log of the well within 30 days after completion of drilling. You should insist and ensure that both of these are done.

For your future use, a Change of Well Information form is enclosed should it become needed. Per ARS §45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep the well registration file current and accurate.

Sincerely,

Richard A. Gessner  
Chief, Operations Division

# LOG OF WELL

Indicate depth at which water was first encountered, and the depth and thickness of water bearing beds. If water is artesian, indicate depth at which encountered, and depth to which it rose in well.

From (feet)	To (feet)	Description of formation material
0	40	Brown Clay
40	50	TUFFA
50	200	Purple Macapaj
200	300	Red " "
300	445	BLACK " "
445	460	Red Decomp. Granite (course)
460	500	Red Granite
500	525	Green Decomp. Gr.

I hereby certify that this well was drilled by me (or under by supervision), and that each and all statements herein contained are true to the best of my knowledge and belief.

WELL DRILLER REPORT

This report should be prepared by the driller in all detail and filed with the Department within 30 days following completion of the well.

- 1. Owner Name: Edward Nole  
Address: 2821 E. COLLE DIMAS Kingman AZ 86401  
Street City State Zip
- 2. Driller Name: Penrod Drilling Co.  
Address: 3020 JAGERSON AVE Kingman AZ 86401  
Street City State Zip
- 3. Location: 22 (NS) 16 (EW) 6  $\frac{1}{4}$  SE  $\frac{1}{4}$  SW  $\frac{1}{4}$  NE  
Township Range Section 10-acre 40-acre 160-acre
- 4. Well Registration No. 55-552313 (Required)
- 5. Permit No. \_\_\_\_\_ (If issued)

DESCRIPTION OF WELL

- 6. Total depth of hole 950' ft.
- 7. Type of casing STEEL EPUC
- 8. Diameter and length of casing 7 in. from 0 to 20, 4 1/2 in. from 0 to 950
- 9. Method of sealing at reduction points \_\_\_\_\_
- 10. Perforated from 880 to 950, from \_\_\_\_\_ to \_\_\_\_\_ from \_\_\_\_\_ to \_\_\_\_\_
- 11. Size of cuts 1/8 x 6 Number of cuts per foot 2
- 12. If screen was installed: Length \_\_\_\_\_ ft. Diam \_\_\_\_\_ in. Type \_\_\_\_\_
- 13. Method of construction drilled  
(drilled, dug, driven, bored, jetted, etc)
- 14. Date started 11-6-95  
Month Day Year
- 15. Date completed 12-14-95  
Month Day Year
- 16. Depth to water 880 ft. (If flowing well, so state)
- 17. Describe point from which depth measurements were made, and give sea-level elevation if available  
ground
- 18. If flowing well, state method of flow regulation: \_\_\_\_\_
- 19. Remarks: \_\_\_\_\_

## LOG OF WELL

Indicate depth at which water was first encountered, and the depth and thickness of water bearing beds. If water is artesian, indicate depth at which encountered, and depth to which it rose in well.

From (feet)	To (feet)	Description of formation material
0	30	Brown Clay Rock & Boulders, Sand, Alaval
30	165	Black Basalt Hard
165	270	White & Black Granite <sup>Water At Granite Contact some small</sup> Fractures
270	320	Black Granite Hard
320	475'	Pink & White Quartz in White Granite
475	606	White & Black Granite <sup>Very Small</sup> Fractures
606	650	Black Hard Granite
165		Water coming in At Fractures less than 2" Total Depth of Fracture
475		Less than 2" Fracture
		Total Water Production Approx 2 GPM

I hereby certify that this well was drilled by me (or under by supervision), and that each and all statements herein contained are true to the best of my knowledge and belief.

COMPLETION REPORT

1. Completion Report to be filed with the Department within 30 days after installation of pump equipment.
2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least 4 hours and for a flowing well by measuring the natural flow at the land surface.
3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than 4 hours of continuous operation and while still in operation and for a flowing well the shut-in pressure should be measured in feet above the land or in pounds per square inch at the land surface.
4. The static groundwater level should be measured in feet from the land surface immediately prior to the well capacity test.

RECEIVED

OCT 6 - 1983

WATER RESOURCES

LOCATION OF THE WELL

T.22N., R.16W., Sec. 28, NW-1/4 - Mohave County, Arizona

Date Well Completed December 17, 1982 Depth of Well 1,006 feet

1. Well Test:

Test Pumping Capacity 2,400 Date Well Tested January 3, 4, 5, 6, 1983  
(Gal. per min.)

Method of Discharge Measurement orifice  
(weir, orifice, current meter, etc.)

Static Groundwater Level 531.0 ft. Drawdown 44.5 ft.

Total Pumping Lift 575.5 ft. Drawdown \_\_\_\_\_ lbs.  
(Flowing Well)

2. Equipment Installed:

Kind of Pump Turbine

Well Site B(28-16) 28bda  
File No. 22

COMPLETION REPORT

1. A Completion Report is to be filed with the Department within 30 days after installation of pump equipment.
2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least four hours and for a flowing well by measuring the natural flow at the land surface.
3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than four hours of continuous operation and while still in operation and for a flowing well the shutin pressure should be measured in feet above the land or in pounds per square inch at the land surface.
4. The static groundwater level should be measured in feet from the surface immediately prior to the well capacity test.

LOCATION OF THE WELL:

Kingman, Arizona

Date well completed 12-3-82 Depth of well 1006'

1. Well Test:

Test pumping capacity 2400 Date well tested Jan 3-6, 1983  
(Gallons per minute)

Method of discharge measurement Orifice  
(Weir, orifice, current meter, et cetera)

Static groundwater level 531.3 Feet drawdown 43.7 feet

Total pumping lift 575 Feet drawdown N/A pounds  
(flowing well)

2. Equipment Installed:

Kind of pump Not installed as yet  
(Turbine, centrifugal, et cetera)

Kind of power \_\_\_\_\_ Horse power rating of motor \_\_\_\_\_  
(Electric, natural gas, et cetera)

I HEREBY CERTIFY that the above statements are true to the best of my knowledge and belief.

RE: Registration No. 55-504272  
File No. B(28-16) 28bda

AZ Department of Water Resources  
99 E. Virginia Avenue  
Phoenix, AZ 85004

Attn: Richard A. Gessner  
Chief, Operations Branch

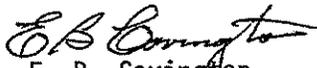

Gentlemen:

In our review of your letter dated November 2, 1982, copy attached, we noticed that the wrong Township has been used in describing the location of the well in the Notice of Intention to Drill a Well. The proposed well will be located in Township 22 North, and not in Township 28 North.

We accordingly believe that the File No. should be B(22-16)28 bda.

Please advise us of what should be done to correct this error. If necessary a new Notice of Intention can be filed.

Sincerely,

  
E. B. Covington  
Asst. Public Works Director

Registration No. 55-504272

Dear Well Owner:

A copy of Notice of Intention to Drill a Well is returned to you for your records. Your driller has been mailed separately a Well Drilling Card, Well Drilling Report, and a Completion Report.

Arizona Revised Statute 45-600 requires the driller to furnish this Department a complete and accurate log of the well within 30 days of completion of drilling, and a Completion Report within 30 days after installation of pumping equipment.

Also enclosed for your future use is a Change of Well Information form. Per Arizona Revised Statute 45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and information pertaining to the physical aspects of the well to keep the well registration record current and accurate.

In the event it is necessary to change the location of the proposed well, you should obtain the written permission of the Department of Water Resources before proceeding with the drilling.

Further, from the information you have provided, it appears that your well is near the Colorado River. If in the future, it is determined that the water from your well is supplied from the river, and you do not have a perfected water right to Colorado River water established prior to 1929, the U.S. Bureau of Reclamation may require you to either cease pumping or enter into a contract for use of Colorado River water.

Sincerely,

Richard A. Gessner  
Chief, Operations Branch

### LOG OF WELL

Indicate depth at which water was first encountered, and the depth and thickness of water bearing beds. If water is artesian, indicate depth at which encountered, and depth to which it rose in well.

From (feet)	To (feet)	Description of formation material
0	20	very soft sand gravel
20	365'	mostly gravel alluvium, some clay mix
365'	368	clay
368	535	sand, gravel, clay mix
535	593	volcanic tuffa, fracture at 563
593	730	hard rhyolite
730	760	brown clay
760	765	gray, brown rhyolite
765	840	red clay
840	870	brown clay
870	895	tan clay
895	903	rhyolite
903	940	tan clay with some rhyolite, <u>3-7 gpm at 900'</u>
		Well is caving in at 3 areas: 560', 760' and 900'.
		We couldn't get PVC casing past 560'
		We pulled casing out + we may case with

I hereby certify that this well was drilled by me (or under my supervision), and that each and all statements herein contained are true to the best of my knowledge and belief.

*Steel casing at a later date.*

## SPECIFIC INSTRUCTIONS, LIMITATIONS AND CONDITIONS

1. If any water from a proposed well on a parcel of land of twenty or fewer acres will be used for domestic purposes, as defined in § 45-454, the applicant shall submit a site plan to scale of the property with the county assessor's parcel identification number. The site plan:
  - a. Will be on a 8½"x11" piece of plain paper with representation of the locations of all structures, septic tank or sewer systems and proximity of adjacent lot lines to scale.
  - b. Must show the proposed well location and the location of any septic or sewer system that is either located on the property or within one hundred feet of the proposed well site.
  - c. Shall demonstrate to the director's satisfaction that the well will not be drilled within one hundred feet of any septic or sewer system.
  - d. Must be approved by the county health authority, or by a local health authority in areas where the county health authority has delegated authority to approve septic or sewer systems. Before approval, the health authority shall review the plan and determine whether the proposed well location complies with applicable state and local laws regarding the placement of wells. If so, the health authority shall endorse the site plan and the proposed well placement.
2. Endorsement by the county/local authority is based solely on the best available judgement that this well, as shown on the site plan submitted, is 100 feet or more from all known and visually identifiable sewage treatment systems. It is not a representation that a well placed at this site will be guaranteed as to quantity or quality. Information brought to light at a future date may render this determination invalid.
3. If a well which was originally drilled as an exploration well, a monitor well, a piezometer well or for any use other than domestic use and is later proposed to be converted to use for domestic purposes, as defined in § 45-454, the well owner shall file a notice of intention to drill and comply with the requirements prescribed pursuant to this section before the well is converted and any water from that well used for domestic purposes.
4. Only a well driller licensed in the State of Arizona is authorized to drill, deepen or modify a well. A well driller may commence drilling a well only if the well drilling contractor or licensee has possession of a drilling card at the well site, issued by the Director in the name of the well drilling contractor or licensee, authorizing the drilling of the specific well in the specific location.
5. An exempt well means a well having a pump with a maximum capacity of not more than thirty-five (35) gallons per minute and may include the application of water to less than two (2) acres of land in an Irrigation Non-Expansion Area or Active Management Area to produce plants or parts of plants for sale, human consumption or for use as feed for livestock, range livestock or poultry.
6. The drilling, deepening, or modification of this well shall be completed within one (1) year of the date of the notice (§ 45-596.E.).
7. Within thirty (30) days after the installation of pumping equipment on this well, the registered well owner shall file the prescribed Completion Report. A form for this purpose will be furnished to the registered owner with the return of an annotated copy of this notice.
8. The person to whom a well is registered shall notify the Department of a change in ownership or a change in data relating to this well. The prescribed form for these purposes will be furnished to the registered owner with the return of an annotated copy of this Notice.
9. If an individual other than the land owner or lessee signs this Notice, an original letter of authorization from the land owner/lessee, stating that the individual has permission to sign this specific Notice on their behalf, shall accompany the Notice.

3997 E. AIRWAY AVE.  
KINGMAN, AZ. 86401

Registration No. 55-553041

File No. B(21-16)3BAB

Dear Well Owner:

Enclosed is a copy of the Notice of Intention (NOI) to drill/deepen/replace/modify a well. This NOI, which was recently filed with this Department, is being returned to you as evidence of your compliance with ARS §45-596. The enclosed Completion Report is to be submitted when pump equipment is installed. The Drilling Card and Well Drilling Report form have been sent to your driller. He may not begin drilling until he has received the Drilling Card and it must be displayed on the rig during drilling. If you change drillers, you must supply this Department with the new driller's identity. Please ensure that the driller you select is licensed to drill the type of well you require. All well drillers must pass an examination proving they understand the drilling methods for that particular license, and are familiar with the laws and regulations which govern well construction in Arizona.

If it is necessary to change the location of the proposed well, immediately contact the Department of Water Resources to obtain written permission before proceeding with the drilling. A properly signed, amended Drilling Card must be in the possession of the driller before drilling commences at a different location than originally authorized. In no case may the replacement well be more than 660 feet from the well it is replacing.

ARS §45-600 requires the registered well owner to submit a completion report within thirty (30) days after the installation of pumping equipment. It also requires the driller to furnish this Department a complete and accurate log of the well within thirty (30) days after completion of drilling. You should insist, and ensure, that both of these are done.

If in the course of drilling a new well, it is determined that the new well cannot be successfully completed as initially intended (dry hole, cave in, lost tools, etc.), the new well must be properly abandoned and a Well Abandonment Completion Report submitted per R12-15-816.F.

Per ARS §45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep this well registration file current and accurate. We have enclosed a Change of Well Information Form should it be needed in the future. If, in the future, it is determined that water from your well is supplied from the river and you do not have a perfected water right to Colorado River water established prior to 1929, the U.S. Bureau of Reclamation may require you to cease pumping or enter into a contract for use of Colorado River water.

Sincerely,

  
Ellen C. Kane

COMPLETION REPORT

1. A Completion Report is to be filed with the Department within 30 days after installation of pump equipment.
2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least four hours and for a flowing well by measuring the natural flow at the land surface.
3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than four hours of continuous operation and while still in operation and for a flowing well the shutin pressure should be measured in feet above the land or in pounds per square inch at the land surface.
4. The static groundwater level should be measured in feet from the surface immediately prior to the well capacity test.

LOCATION OF THE WELL:

TWP 22N RGE 16W SEC 34 NE 1/4 SW 1/4 NW 1/4

Date well completed JULY 1981 Depth of well 700

1. Well Test:

Test pumping capacity 100 Date well tested JULY 1981  
(Gallons per minute)

Method of discharge measurement METER  
(Weir, orifice, current meter, et cetera)

Static groundwater level 575 Feet drawdown 40 feet

Total pumping lift 650 Feet drawdown \_\_\_\_\_ pounds  
(flowing well)

2. Equipment Installed:

Kind of pump SUBMURGIBLE  
(Turbine, centrifugal, et cetera)

Kind of power ELECTRIC Horse power rating of motor 15  
(Electric, natural gas, et cetera)

I HEREBY CERTIFY that the above statements are true to the best of my knowledge and belief.

Registration No. 55-500156

Dear Well Owner:

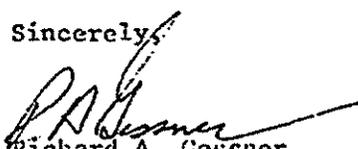

A copy of Notice of Intention to Drill a Well is returned to you for your records. Your driller has been mailed a Well Drilling Card, Well Drilling Report, and a Completion Report.

ARS 45-600 requires the driller to furnish this Department a complete and accurate Log of Well within 30 days of completion of drilling, and a Completion Report within 30 days after installation of pumping equipment.

Also enclosed for your future use is a Change of Well Information form. Per ARS 45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and information pertaining to the physical aspects of the well to keep the well registration record current and accurate.

In the event it is necessary to change the location of the proposed well, you should obtain the written permission of the Department of Water Resources before proceeding with the drilling.

Sincerely,

  
Richard A. Gessner

COMPLETION REPORT

1. A Completion Report is to be filed with the Department within 30 days after installation of pump equipment.
2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least four hours and for a flowing well by measuring the natural flow at the land surface.
3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than four hours of continuous operation and while still in operation and for a flowing well the shutin pressure should be measured in feet above the land or in pounds per square inch at the land surface.
4. The static groundwater level should be measured in feet from the surface immediately prior to the well capacity test.

LOCATION OF THE WELL:

Kingman, Arizona

Date well completed 12-3-82 Depth of well 1006'

1. Well Test:

Test pumping capacity 2400 Date well tested Jan 3-6, 1983  
(Gallons per minute)

Method of discharge measurement Orifice  
(Weir, orifice, current meter, et cetera)

Static groundwater level 531.3 Feet drawdown 43.7 feet

Total pumping lift 575 Feet drawdown N/A pounds  
(flowing well)

2. Equipment Installed:

Kind of pump Not installed as yet  
(Turbine, centrifugal, et cetera)

Kind of power \_\_\_\_\_ Horse power rating of motor \_\_\_\_\_  
(Electric, natural gas, et cetera)

I HEREBY CERTIFY that the above statements are true to the best of my knowledge and belief.

RE: Registration No. 55-504272  
File No. B(28-16) 28bda

AZ Department of Water Resources  
99 E. Virginia Avenue  
Phoenix, AZ 85004

Attn: Richard A. Gessner  
Chief, Operations Branch

Gentlemen:

In our review of your letter dated November 2, 1982, copy attached, we noticed that the wrong Township has been used in describing the location of the well in the Notice of Intention to Drill a Well. The proposed well will be located in Township 22 North, and not in Township 28 North.

We accordingly believe that the File No. should be B(22-16)28 bda.

Please advise us of what should be done to correct this error. If necessary a new Notice of Intention can be filed.

Sincerely,

  
E. B. Covington  
Asst. Public Works Director

B(28-16)28bda

Registration No. 55-504272

Dear Well Owner:

A copy of Notice of Intention to Drill a Well is returned to you for your records. Your driller has been mailed separately a Well Drilling Card, Well Drilling Report, and a Completion Report.

Arizona Revised Statute 45-600 requires the driller to furnish this Department a complete and accurate log of the well within 30 days of completion of drilling, and a Completion Report within 30 days after installation of pumping equipment.

Also enclosed for your future use is a Change of Well Information form. Per Arizona Revised Statute 45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and information pertaining to the physical aspects of the well to keep the well registration record current and accurate.

In the event it is necessary to change the location of the proposed well, you should obtain the written permission of the Department of Water Resources before proceeding with the drilling.

Further, from the information you have provided, it appears that your well is near the Colorado River. If in the future, it is determined that the water from your well is supplied from the river, and you do not have a perfected water right to Colorado River water established prior to 1929, the U.S. Bureau of Reclamation may require you to either cease pumping or enter into a contract for use of Colorado River water.

Sincerely,

A handwritten signature in dark ink, appearing to read "R. Gessner".

Fill out this form in duplicate and mail to P.O. Box 2600, Phoenix, Arizona, 85002, or deliver to 222 North Central Avenue, Suite 550, Phoenix, Arizona 85004.

If the Non-exempt well is in fact a replacement (or deepening) well, state the registration number of the existing well.

Construction standards for new and replacement wells and the deepening and abandonment of existing wells shall be in accordance with department rules and regulations.

This form should also be used to replace or deepen an existing irrigation well in an irrigation non-expansion area. However, water from an irrigation well drilled, deepened or replaced in a non-expansion area may not be used to increase the acreage as authorized by ARS 45-434.

I, \_\_\_\_\_, state that the construction will be under the direct and personal supervision of the well driller designated on this form and that the designated driller holds a contractor's license pursuant to ARS 45-595.

Department license number

Fill out this form in duplicate and mail to P.O. Box 2600, Phoenix, Arizona, 85002, or deliver to 222 North Central Avenue, Suite 550, Phoenix, Arizona 85004.

If the Non-exempt well is in fact a replacement (or deepening) well, state the registration number of the existing well.

Construction standards for new and replacement wells and the deepening and abandonment of existing wells shall be in accordance with department rules and regulations.

This form should also be used to replace or deepen an existing irrigation well in an irrigation non-expansion area. However, water from an irrigation well drilled, deepened or replaced in a non-expansion area may not be used to increase the acreage as authorized by ARS 45-434.

state that the construction will be under the direct and personal supervision of the well driller designated on this form and that the designated driller holds a contractor's license pursuant to ARS 45-595.

Registration No. 55-504272

Dear Well Owner:

A copy of Notice of Intention to Drill a Well is returned to you for your records. Your driller has been mailed separately a Well Drilling Card, Well Drilling Report, and a Completion Report.

Arizona Revised Statute 45-600 requires the driller to furnish this Department a complete and accurate log of the well within 30 days of completion of drilling, and a Completion Report within 30 days after installation of pumping equipment.

Also enclosed for your future use is a Change of Well Information form. Per Arizona Revised Statute 45-593, the person to whom a well is registered shall notify this Department of a change in ownership of the well and information pertaining to the physical aspects of the well to keep the well registration record current and accurate.

In the event it is necessary to change the location of the proposed well, you should obtain the written permission of the Department of Water Resources before proceeding with the drilling.

Further, from the information you have provided, it appears that your well is near the Colorado River. If in the future, it is determined that the water from your well is supplied from the river, and you do not have a perfected water right to Colorado River water established prior to 1929, the U.S. Bureau of Reclamation may require you to either cease pumping or enter into a contract for use of Colorado River water.

Sincerely,

Richard A. Gessner  
Chief, Operations Branch

## LOG OF WELL

Indicate depth at which water was first encountered, and the depth and thickness of water bearing beds. If water is artesian, indicate depth at which encountered, and depth to which it rose in well.

I hereby certify that this well was drilled by me (or under my supervision), and that each and all of the statements herein contained are true to the best of my knowledge and belief.

COMPLETION REPORT

1. Completion Report to be filed with the Department within 30 days after installation of pump equipment.
2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least 4 hours and for a flowing well by measuring the natural flow at the land surface.
3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than 4 hours of continuous operation and while still in operation and for a flowing well the shut-in pressure should be measured in feet above the land or in pounds per square inch at the land surface.
4. The static groundwater level should be measured in feet from the land surface immediately prior to the well capacity test.

RE: Registration No. 55-502501

AZ Department of Water Resources  
99 E. Virginia Avenue  
Phoenix, AZ 85004

Attn: Richard A. Gessner  
Chief, Operations Branch

Gentlemen:

In reply to your letter dated October 29, 1982, copy attached, please be advised that the well has been drilled and completed as an observation well substantially in accordance with the details described in the Notice of Intention to Drill an Exempt Well filed by the drilling contractor. There will be no pumping equipment installed in the well.

The Contract provides that the necessary well log and completion reports will be completed and filed by the Contractor, but apparently this has not been done. By means of a copy of this letter, we are reminding the contractor of this requirement.

Thanks for bringing this oversight to our attention.

Sincerely,

E. B. Covington  
Asst. Public Works Director

KINGMAN AZ 86401

Gentlemen:

The Department of Water Resources issued drilling authority six months ago for the well referenced by our file number on the label at the top of this form. Our records show that this well has not yet been completed.

Our experience shows that most wells are drilled soon after filing. Consequently, this letter is only intended as a courteous reminder that if the well has been completed, certain reports are required. If the well has not been drilled, you have some months remaining to complete the well.

Arizona Revised Statute 45-600 requires the driller to furnish a complete and accurate Log of the Well within 30 days of completion of drilling. Within 30 days after the installation of the pump equipment, a Completion Report is required.

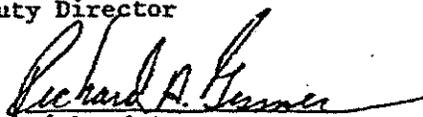

Specifically, if your well has been completed, we need the following report(s) to bring the well into full compliance with the law:

1. Have Log of Well,
2. ✓ Completion Report.

We will appreciate your immediate assistance in reporting if you have drilled or completed your well. Please contact this office if further assistance or information is required.

Sincerely,

W. Don Maughan  
Deputy Director

DEPARTMENT OF WATER RESOURCES  
NOTICE OF INTENTION TO DRILL OR DEEPEN  
AN EXEMPT WELL

EXEMPT WELL

Section 45-596, Arizona Revised Statutes, provides: A person may not drill or cause to be drilled a well or deepen or replace an existing well without first filing a Notice of Intention to Drill with the Department on a form prescribed and furnished by the Department. The well shall be completed within one year after the date of Notice. An exempt well means a well having a pump with maximum design capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An exempt well may include the non-commercial irrigation of not more than 1 acre of land.

**APPENDIX C**

---

**TECHNICAL MEMORANDUM**

---

**TO:** Scott Yocum (City of Kingman), Dale Armstrong (Clear Creek Associates)  
**FROM:** Robert McGill (hydroGEOPHYSICS, Inc.)  
**SUBJECT:** Gravity Results for the Airport Sub-basin near City of Kingman  
**DATE:** August 8, 2003

---

**INTRODUCTION**

This technical memorandum presents the results of our gravity survey completed for the Airport Sub-basin Site (herein referred to as the Site). This memorandum was prepared for City of Kingman (City) by hydroGEOPHYSICS, Inc. (HGI) under the City's Purchase Order Number 010660.

***Background***

A planned production well (City Well 8) encountered a highly cemented volcanic conglomerate at an approximate depth of 380 feet. The well was determined to be non-producing and subsequently abandoned. The City requested a gravity survey in order to determine the extent of the volcanic conglomerate and if other gravity responses existed that could be attributed to near surface bedrock features.

The Site area for this investigation is located in the southwestern Hualapai Valley area. The southern Cerbat Mountains serve as the western boundary. The northern extent of the Hualapai Mountains and Interstate 40 serve as the southern boundary. From these boundaries, the study area extends into the valley approximately 12 miles north and 11 miles east.

***Purpose and Objective***

The purpose of this investigation was to acquire sufficient gravity data so that a relative depth-to-bedrock image could be constructed. The objective of this investigation was to

provide additional information that will better define relatively shallow subsurface bedrock areas that in turn, could help better place future production wells for the City.

HGI had recommended that any available aeromagnetic data be reprocessed and correlated with the gravity results. Unfortunately, only regional aeromagnetic coverage exists for the area and does not have the sufficient line spacing that would allow useful characterization. The budget that was initially reserved for aeromagnetic processing was therefore applied to additional gravity data acquisition.

## **GRAVITY SURVEY METHOD AND RESULTS**

### ***Method***

Gravity surveying is a geophysical method that aids in determining the depth-to-bedrock, overall basin geometry within, and surrounding a site, and relative changes in bedrock topography. Lateral differences in gravitational attraction are caused by contrasting densities of geologic media, such as alluvium versus bedrock, along with a myriad of other influences that are accounted for in processing. The information gained from the survey determines relative depth to bedrock estimates over a defined investigation area. Gravity surveying can also define the locations of possible buried geologic structures.

By taking several gravity measurements within an area at discrete points, a contoured gravitational map is developed. The map is used to determine the location of lower density alluvial deposits versus higher density shallow bedrock. Acquired field data are processed and typically presented in both plan and modeled cross-sectional plots.

### ***Logistics***

Gravity data were acquired from June 11th through 16th, and July 22nd, 2003. A total of 108 new gravity stations were established during this time period.

Each gravity station was located using hand-held GPS equipment. The purpose of the GPS surveying was to accurately determine gravity station locations and acquire elevation data, which are used to process gravity data.

Daily gravity loops were tied to a state gravity field base station located at the western edge of Edward Beale Memorial Park. The park is located at the juncture of U.S.

Highways 93 and 66. The field station was subsequently tied to our base station at our Tucson office.

A Scintrex Autograv Model CG-3 gravimeter (S/N 9610345) was used for gravity data acquisition. Daily loops were tied to the afore-mentioned base station, to account for instrumental drift. A Garmin Etrex Vista hand-held GPS unit was used for positional and vertical control. The Garmin unit was calibrated several times a day using known elevation controls, such as benchmarks. The elevation data were additionally quality checked against topographic contours on USGS 7.5-minute quadrangle maps.

### ***Data Reduction***

Gravity data reduction includes the following steps:

- Conversion from dial reading to milligals.
- Removal of solid earth tidal effects.
- Removal of instrumental drift.
- Adjustment of milligal values to the regional base station value to produce absolute gravity values.
- Removal of latitudinal effects.
- Correction for elevation (Free Air Anomaly or FAA).
- Correction for the Bouguer slab (Simple Bouguer Anomaly or SBA).
- Removal of terrain effects (Complete Bouguer Anomaly or CBA).

A regional trend is then removed to produce the Residual Gravity Anomaly (RGA). The trend is commonly referred to as the isostatic trend. It was developed by Dr. Carlos Aiken (1976) for his Ph.D. dissertation as part of his interpretation of the statewide gravity survey. The regional trend was originally presented by Dr. Robert West (1972), in his Ph.D. dissertation. It uses a two-dimensional Fourier series surface based on regional elevation trends and deep-crustal density compensation.

The density used for the Bouguer slab reduction is 2.67 g/cc, which is the crustal average density for the earth.

Gravity is measured as acceleration due to gravitational pull, or gravitational force per unit mass. Final data values are presented in units of milligals (abbreviated mGal), which

are  $10^{-3}$  Gal (1 Gal =  $1 \text{ cm/s}^2 = 10^{-2} \text{ m/s}^2 = 10^{-2}$  newton/kg). The Earth's nominal gravity is 980 Gal.

After the data were quality checked, they were integrated into our gravity database. No points were rejected from the data set acquired for this project. A few existing points from the database were rejected due to non-matching values.

### **Results**

Attached to this memorandum are five figures representing the gravity data results and gravity models for the Site.

Figure 1 is a topographic base map of the study area and vicinity showing the gravity station distribution for the area, as well as the RGA contoured values. This map represents the gravity results after the isostatic trend was removed. Blue dots are the stations established for this survey, and red dots represent stations existing within the database. Two gravity profiles are presented as red lines.

Figure 2a is one of two versions of profile A-A' that begins at Bull Mountain and extends eastward, towards the main gravity low. Figure 2b uses the same gravity profile, but uses lithologic constraints. Figure 3a shows the modeled results for profile B-B' at an extended scale. Figure 3b is the same model, but with an expanded vertical scale.

The modeled profiles were developed by the following steps:

- Preferentially orient the profiles to cross major gravity responses orthogonally (gravity modeling software must assume an infinite strike length of the modeled body in the third dimension).
- Digitize the contoured gravity responses along the chosen profiles.
- Integrate elevation data from the two DEMs covering the area and gravity station elevations acquired in the field.
- Import the matched topographic and gravity data into the software modeling package GM-SYS.
- Construct (initially) a simple geologic model by incorporating known geologic information.
- Refine the model by adjusting the geometry of polygonal bodies and provide the best fit of calculated versus “observed” data.

- Analyze the results and provide additional versions where appropriate if complex geology exists.

It should be noted that the “observed” values shown on the upper pane of the modeled profiles are actually interpolated values that were extracted after kriging of the data was completed.

For all modeled cross-sections, the upper pane represents the gravity response along the chosen profile orientation. The lower pane represents the modeled geologic section.

### ***Interpretation***

Our interpretation is based upon the general trends evident in the RGA plots, the modeled gravity profiles, and correlations with other geo-related data.

RGA values range from -30 to -5 milligals. The highest values represent exposed or relatively shallow bedrock, whereas the lower values generally represent increasing alluvial thickness.

A dominant gravity low for the area is centered approximately two miles north and one-half mile east of the Kingman Airport complex. This gravity low strikes northeast-southwest and appears to extend to the southwest, towards Sawmill Canyon Road. The center of the gravity low and its lateral extent suggests that the thickest deposits of alluvium exist in the eastern half of the Site area. The northern and eastern extent of the gravity low response is not well defined by this study. The extension of the gravity low towards Sawmill Canyon suggests a possible inlet/outlet feature that could provide hydrologic connection with the Sacramento Valley. However, additional data acquisition would be necessary in order to confirm this trend.

A gravity high extends into the valley approximately three miles east of Bull Mountain. The highest amplitude of this response is slightly shifted (by roughly one mile) to the south of Bull Mountain. This response is interpreted as either a bedrock shelf that is relatively near surface and extends out into the basin locally, or some other type of high-density lithology (such as the volcanic conglomerate). It is most likely a combination of a bedrock extension as well as additional high-density material above the bedrock. Note that the gravity contours begin to trend back towards the Cerbat Mountains as the contours cross profile A-A’. This “curvature” is interpreted as representing the northern

extension of shallow bedrock. To the south of the gravity high, and towards the sewage disposal ponds, the contours again trend back towards the west.

Another localized gravity high appears to extend into the valley from the upper center portion of the image, just east of profile B-B'. This feature is sympathetic with outcroppings that also extend into the valley from the north/northwest. These outcroppings are comprised of Tertiary volcanic and undifferentiated Precambrian rocks. From the gravity response, it appears that shallow bedrock extends further into the basin by approximately two miles from the southern-most exposed outcrop.

### ***Gravity Models***

For the models, we first assumed a basement bedrock density of 2.67 g/cc, which is the average density for the earth's crust (i.e., basement). We used three density contrasts; 0.3, 0.4, and 0.5 g/cc to represent the alluvium-to-bedrock model. These three contrasts represent average alluvial densities of 2.37, 2.27, and 2.17 g/cc, respectively. For three of the models (Figs. 2a, 3a, and 3b), three density contrasts representing unconsolidated basin fill are displayed sequentially using different color hues. Our experience in the southwest is that basin fill typically has a density ranging between 2.1 to 2.3 g/cc. Based on this, the two models using densities of 2.17 and 2.27 g/cc are considered the most appropriate.

The attached two-dimensional models show the hypothetical bedrock profile for the three density contrasts as labeled on the plots. For Figure 2b, a volcanic rock member was modeled using representative polygons and densities.

The orientation of profile A-A' shown in Figure 2a was located - in part - based on station control and proximity to City Well 8. The west end of the model is anchored in exposed outcrop (Bull Mountain), while the east side is "unhinged" and ends in surface alluvium. The modeled results show that relatively shallow bedrock extends into the valley by approximately 2-1/2 to 3 miles, before the deeper portion of the basin is encountered (near the intersection of B-B'). After this point, bedrock depth increases rapidly. Using the most conservative estimate of 2.17 g/cc, basin fill is estimated to be approximately 6,000 feet thick at the center of the gravity low.

Since some amount of geologic control existed for City Well 8 (located approximately 1/2-mile north of the profile), we chose to model the same profile using a volcanic lithology

positioned immediately above basement rock and below alluvium. We constrained the depth of the volcanics to 400 feet at station 16,000 along the profile, in order to approximate the results of the well. We also used the modeled depth derived from profile B-B' to constrain the depth estimate for this profile at their intersecting point. This constraint was chosen because profile B-B' was "anchored" in bedrock at each end of the profile, thus providing a more representative estimate of depth-to-bedrock for both profiles. Again, the resulting model, shown in Figure 2b, indicates a lateral extension of basement/volcanics into the valley to approximately 25,000 feet along the profile. Of the two models for profile A-A', Figure 2b is considered more representative of the responses due to the integration of geologic information.

The results of Figures 3a and 3b present a gradually increasing depth-to-bedrock as the profile continues into the valley towards the northwest. The northwestern portion of the profile has been truncated due to complex 3-D geometry of the response patterns encountered in the area. Maximum depth of basin fill is estimated to be approximately 3,200 feet thick using the most conservative sediment density of 2.17 g/cc. The model suggests a northwesterly tilted fault block that may be structurally controlled along the northwestern edge of the sub-basin, due to the abrupt change in gravity responses that are noticeable in both plan and sectional views.

## **CONCLUSIONS & RECOMMENDATIONS**

The gravity results sufficiently define basin geometry and bedrock topography within the main portion of the Site. Additional gravity stations would help define the northern, eastern, and southwestern portions of the basin further, should these areas become a future consideration.

The gravity response within the area of City Well 8 – most noticeable immediately to the south – is interpreted as representing shallow high-density material. Based on modeled gravity results, shallow high-density material appears to laterally extend east into the valley by approximately three miles. The gravity high does not appear to continue for any considerable distance towards the north.

The gravity high agrees with drill log information for wells listed in the ADWR registry. Specifically, for listed City wells:

- 55-576713 (B-22-16-29-aaa) City Well No. 7: “welded volcanic ash” from 300 to 730 feet below ground surface (bgs).
- 55-582951 (B-22-16-32ddd) Test Hole TH-4: “basalt flows and agglomerates” from 600 to 1200 feet bgs.
- 55-571224: (B-22-16-29-aaa) Test Hole 1; “clay gravels” and “sand gravels” to 1,020, volcanic conglomerates to 1,200 feet.

Although the logs of the above-referenced wells are somewhat mixed due to different drilling contractors and personnel being involved, in general wells within the area have encountered highly cemented material to some degree and at different elevations. Also, the basalt flows and agglomerates have proven to provide substantial permeability. The complex geology cannot be resolved by the gravity technique alone, which classifies responses only by densities.

Future well site locations could benefit from other geophysical imaging techniques that may help characterize lithologic conditions within the immediate area, prior to drilling. These methods include resistivity soundings and seismic surveys that tend to work well in stratified geologic environments.

RE: Kingman Basin Study  
Work Order No.: 0304329

Dear Dale,  
Transwest Geochem, Inc. received 7 samples on 4/22/2003 2:27:00 PM for the analyses presented in the following report.

The Case Narrative of this report addresses any Quality Control and/or Quality Assurance issues associated with this Work Order.

If you have any questions regarding these test results, please feel free to call us at (602) 437-0330.

Sincerely,

Beth Proffitt  
Project Manager

**Data Qualifiers**

---

One or more of the following data qualifiers may be associated with your analytical and/or quality control data.

- D1 Sample required dilution due to matrix interference. See case narrative.
- D2 Sample required dilution due to high concentration of target analyte.
- M1 Matrix spike recovery was high, the method control sample recovery was acceptable.

## Definitions

---

Analytical Spike (AS)	The AS is a known amount of a target analyte added to a sample after it has been distilled, digested, or extracted and is ready for analysis. The AS is generally performed if the MS has failed. It is used to indicate interference that arises from sample distillation, digestion, or extraction as opposed to interference that is innate to the matrix.
Continuing Curve Verification (CCV)	The CCV is also referred to as a curve check. This is a standard analyzed at specified intervals during an analysis. The CCV verifies the stability and accuracy of the calibration curve. There are specific CCV recovery acceptance criteria for each method.
Dilution Factor (DF)	The DF is an indication of how much a sample had to be diluted in order to quantitate it on a standard curve. The DF is indicated in the reported sample result. The sample PQL increases as the dilution increases.
Internal Standard (IS)	The IS is a compound that is similar to the organic compound of interest in terms of chemical composition but is unique in that it is rare in the environment. The same concentration of IS is added to every sample for some organic methods.
Laboratory Control Sample (LCS)	The LCS is also referred to as a blank spike. The LCS is an addition of a known amount of a target analyte (from the same source as calibration standards or spikes) to an aliquot of deionized water or other appropriate clean matrix. The LCS is processed through the entire method procedure in the same manner as samples.
Matrix Spike (MS)	The MS is a known amount of a target analyte added to a sample. The MS is processed through the entire method procedure in the same manner as samples.
Method Blank (MB)	The MB is an aliquot of deionized water or other appropriate clean matrix that is thought to be free of the analyte in question. The MB is processed through the entire extraction or analysis procedure and is used to indicate contamination in the lab.
Method Detection Limit (MDL)	The MDL is the lowest level of detection of which a method is capable.
Practical Quantitation Limit (PQL)	The PQL is the lowest value at which Transwest Geochem can detect an analyte in matrix with a high degree of confidence. The PQL will increase as the DF increases. The PQL is greater than or equal to the MDL.
Relative Percent Difference (RPD)	The RPD is a measure of precision (the ability to obtain the same result on re-analysis of the same sample). It is calculated using the result of a sample, MS, LCS, or LCSV and its associated duplicate result.
Secondary Source QC Sample (LCSV)	The LCSV is also referred to as a second source laboratory control sample. It is the same type of standard as a calibration or spiking standard but is obtained from a different source. The LCSV is an indication of the primary standard quality, method performance, and instrument performance.
Surrogate	A surrogate compound is similar to the organic compound of interest in terms of chemical composition but is unique in that it is rare in the environment. When surrogates are used, they are added to every sample, blank and standard. Surrogate recovery is used as an indication of extraction and/or analytical success.
Trip Blank (TB)	The TB is a portion of deionized water preserved in the same manner as the samples. The TB travels from the lab, to the field, and then back to the lab with the samples from the field. The TB serves as an indication of contamination introduced during sample transportation.
